                                                                               Ś
                                                                                                                                                                                RESULT 34
                                                                                                                                                                    The invention relates to isolated nucleic acid molecules encoding cover human secreted extracellular matrix proteins (SPB). The condition in e.g. humans, mice, rabbits, youts, horses, catts, dogs, condition in e.g. humans, mice, rabbits, youts, horses, catts, dogs, condition in e.g. humans, mice, rabbits, youts, horses, catts, dogs, condition in e.g. humans, mice, rabbits, youts, horses, catts, dogs, condition of SPB. The SP polynucleotide or a vector expressing them may compression of SPB. The SP polynucleotide or a vector expressing them may be administered to treat diseases by gene therapy. Antisense molecules can be administed to down regulate expression. The polynucleotides can be used as DNA probes in diagnostic assays. The SPB may also be used as antigens to produce antibodies and to identify modulators (agonists and antagonists) of the SPB. The anti-(SP) antibodies and antagonists may also be used to down regulate expression and activity of SPB and as diagnostic agents for detecting the presence of SPB in samples. The disorders include for example: immune/autoimmune diseases (e.g. HIV (human immunodeficiency virus) infections, anaemia, rheumatoid arthritis and multiple sclerosis), cancers and hyperproliferative disorders (e.g. cardiac, careat, tachycardia and angina), infections caused by bacteria, viruses can fungi and ocular disorders (e.g. corneal infections). Other uses circlude wound healing, maintenance of organs before transplantation,
                                                                                                                             Query Match

The invention relates to novel genes (ABQ66521-ABQ66785) and proteins CC (ABP47846-ABP48110) useful for preventing, treating or ameliorating CC (ABP47846-ABP48110) useful for preventing, treating or ameliorating CC medical conditions e.g. by protein or gene therapy. The genes are CC isolated from a range of human tissues disclosed in the specification. CC The nucleic acids, proteins, antibodies and (ant) agonists are useful CC in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone CC marrow, breast, gastrointestinal tract, liver, lung, or urogenital; CC (b) immune disorders e.g. Addison's disease, allergies, autoimmune cC namelytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's CC disease, multiple sclerosis, rheumatoid arthritis and ulcerative (c) cardiovascular disorders such as myocardial ischaemias; (c) cardiovascular disorders such as myocardial ischaemias; (c) dispersy; and (f) infectious diseases such as viral, bacterial, fungal cand parasitic infections.

CC Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at sequence.html?DocID=999909764870.

Nucleic acids encoding (I) are used to detect Streptococcus in a biological sample. (I) is used to determine whether a compound binds to (I). A composition comprising (I) or a nucleic acid encoding (I), may be used as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity chromatography, immunoassays, and distinguishing/identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Telford J, F
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus againstiae) or group A streptococcus/GAS (Streptococcus spanishing one of 5483 sequences (S1), given in the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN66044-AEN71526 and antibodies that bind (I) are used in the manufacture of medicaments for

                                                                                                    The present sequence is that of the LlaIIC gene product, an endonuclease, part of a Lactococcus lactis restriction/modification (R/M) system. The LlaII R/M system is similar to the MboI system which recognises the sequence 5'-GATC-3' and cleaves it before the guanine. A plasmid contg. the DNA (AAT30440) encoding the R/M system can confer phage resistance to a bacterium, such as providing resistance to phage-sensitive dairy cultures. The DNA and proteins can be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention relates to stabilised recombinant animal cell line expressing envelope 2 protein of HCV. The present sequence represents the envelope 2 protein of HCV.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This AA sequence encodes a restriction endonuclease, R. IlaAI, with the recognition sequence 5'-*GARC-3' (* indicatting point of cleavage) from the plasmid-derived type-II restriction-modification system from Lactococcus lactis subsp. cremoris W9, LlaAI. R. IlaAI is one of 3 proteins in this restriction-modification system, along with a 284 AA methylase (M.IlaAIA, AAW02160), and a 269 or 257 AA methylase (M.IlaAIB, AAW02162, respectively). This restriction-modification system may be used in a methylase conferring increased virus resistance, more specifically phage resistance, to a L. lactis errate resistance, more specifically phage resistance, to a L. lactis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (JOSE/)

                                                                                                                                                                                                                         Ś
                                                                                                                                                                                                                                                                                                                                                             The invention relates to a protein (ABP25413-ABP30895) from group B CC streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GAS (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in the specification. The proteins have antibacterial and antiinflammatory cativity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and cativity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and cativity and the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. CC Nucleic acids encoding (I) are used to detect Streptococcus in a streptococcus in a streptococcus in a streptococcus in a streptococcus in a streptococcus in a streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity immunoassays, and distinguishing/identifying
                                                                                                                                                                                                                                                                          Query Match

Patent No. US20020157120A1
GENERAL INFORMATION:
APPLICANT: THE REGENTS OF THE UNIVERSITY OF CALIFORNIA
APPLICANT: Tsien, Roger Y.
APPLICANT: Baird, Geoffrey
TITLE OF INVENTION: CHROULARLY PERMUTED FLUORESCENT PROTEIN INDICATORS
FILE REFERENCE: REGEN1470-1
CURRENT APPLICATION NUMBER: US/09/99,745
CURRENT FILING DATE: 2001-10-23
PRIOR APPLICATION NUMBER: 09/316,920
PRIOR APPLICATION NUMBER: 09/316,920
PRIOR TLING DATE: 199-05-21
NUMBER OF SEQ ID NOS: 67
SOFTWARE: PatentIn version 3.0
